Trump and the U.S. Economy: Downside Risks Materialize

- Aside from immigration restrictions, three macro-significant actions took place since Trump took office:
 - i. A spat with Colombia showed Trump in deal-maker mode: the president threatened tariffs, travel bans, and financial/banking sanctions, and then backed down once he got what he wanted.
 - ii. A funding freeze memo by the OMB would probably have caused a recession had it not been blocked and then rescinded.
 - iii. Finally, tariffs imposed on Canada, China, and Mexico are a macro-significant, inflationary supply shock with positive revenue implications. (basically a tax hike)
- We view these developments as leading to slower growth and higher inflation. Our base case sees Canada and Mexico tariffs reduced over the next 6 months as part of a USMCA renegotiation.
- The Fed will have to respond, and we continue to expect no cut before May. Hikes this year are not out of the question.
- In the short run, these developments are bad for equities, bad for short-term rates, ambiguous on the 10-year, and good for USD.

Canada/China/Mexico: Tariffs as an End in Themselves

- On Saturday, U.S. President Donald Trump announced a 25% tariff on all Canadian goods and all Mexican goods.
- A 10% tariff was imposed on Canadian energy goods and all Chinese goods.
- The tariffs account for around half of U.S. imports and will dramatically increase customs revenue.
- They will be inflationary (estimates are of about 70bps of PCE) and harm growth and U.S. competitiveness—most Canadian and Mexican imports are resources and intermediate goods.
- Both countries will implement counter-tariffs.
- Countries and corporates will try to negotiate with the Trump administration for exemptions—essentially an accelerated version of the USMCA renegotiation conducted under duress.
- Our base case sees most MX/CA tariffs lifted within 6 months, probably on a gliding scale.

The Fed has to react—and the reaction is hawkish

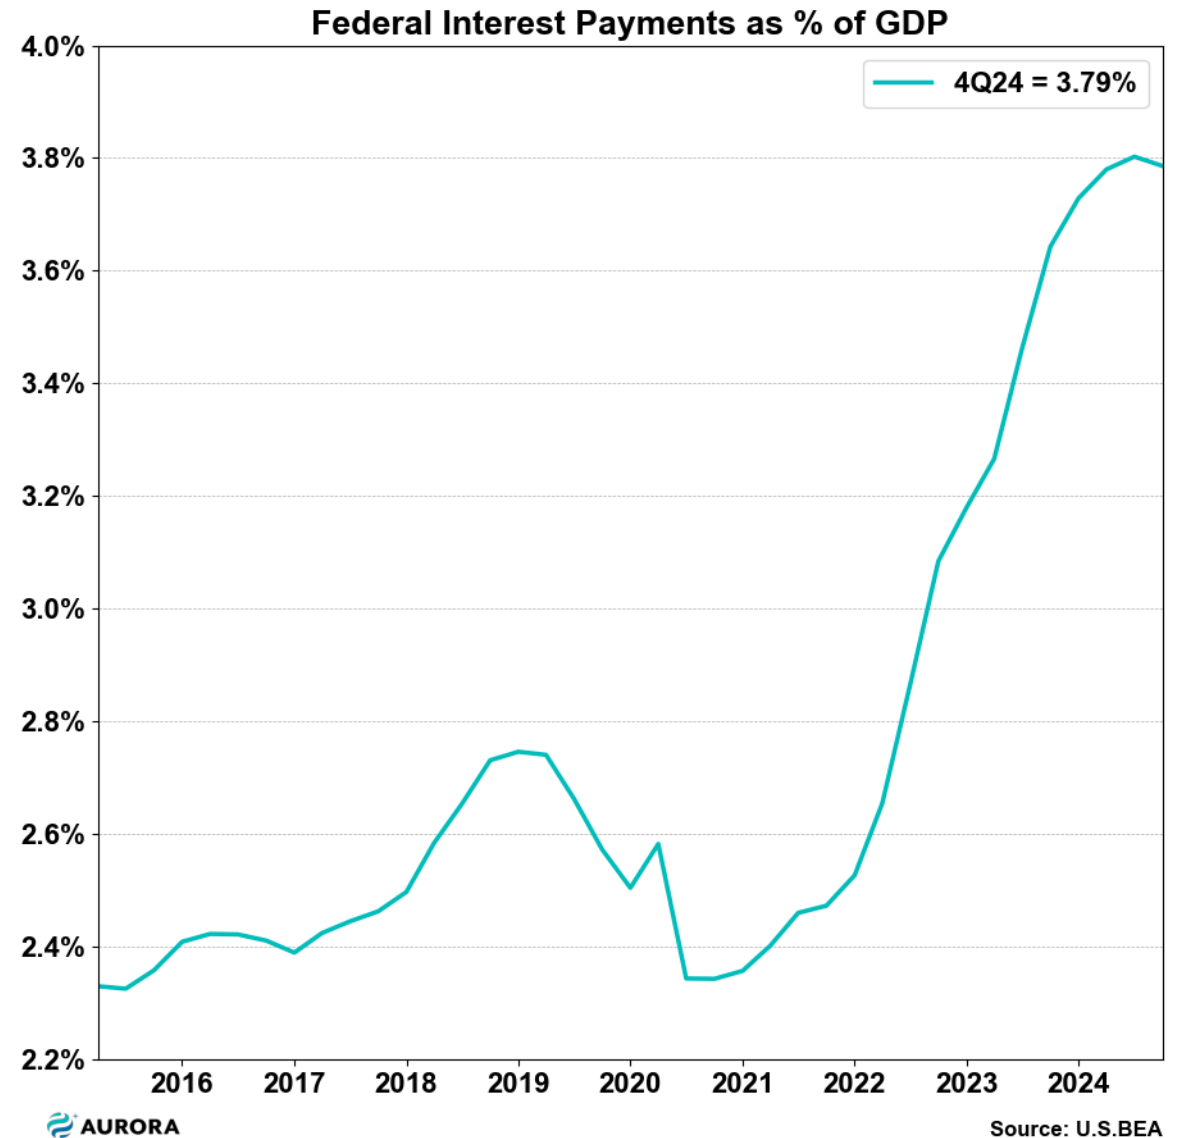

- Though the December print was on the softer end of expectations, core inflation remains about 30-40bps above the Fed's comfort level.
- Headline is (i) the Fed's formal target and (ii) important for inflation expectations. It will undoubtedly be hit by the tariffs, as energy, food, and goods prices adapt.
- In his press conference last week, Powell insinuated that the FOMC would wait to see the effect of tariffs before acting.
- We find this hard to believe. A majority (see [Dec minutes](#)) already thinks trade and immigration policy are inflationary and warrant higher rates.
- A minority led by Christopher Waller claim that tariffs will not be inflationary and further cuts are coming.
- The hawks have it for now: we view no action between now and May and see the March meeting as a flashpoint for a hawkish surprise.

Fiscal risks will dominate in Q2

- Higher rates have become a problem for the federal government, which is spending an increasing part of its budget on interest.
- Here, the tariffs have an ambiguous effect: inflationary pressures and the Fed reaction are bearish, while slower growth and higher tariff revenues are bullish.
- As a reminder, the Treasury has already hit the debt ceiling and will now have to run down the TGA to make payments until Congress acts.
- We still expect Congress to pass a mildly expansionary budget, but its headroom will be limited if 10-year rates pick up.
- In our view, higher rates represent the single most important risk to the administration's agenda—and to continuing U.S. economic outperformance.

The Long Run: Trump Viewed from Abroad

- The Colombia kerfuffle last weekend ended up being macroeconomically insignificant for both countries.
- But it could prove to be an episode with significant long-term consequences.
- In particular, Trump's threat to impose financial and banking sanctions over a seemingly unrelated matter (the manner of deportation flights) raises serious question about the U.S.'s role as nexus of global finance.
- Though there is no ready alternative to the USD, we would expect neutral countries to continue diversifying their reserves into gold and alternative currencies.
- This poses additional risks for the U.S. treasuries market, though we expect these to materialize slowly over the coming years.
- U.S. fiscal problems are far more pressing, and domestic bondholders may well rebel before foreign demand wanes meaningfully.
